

# Related Posts With Jekyll

I wanted something that would show up to 5 recent posts of the same category. Jekyll has a `related_posts` site [variable](#), but it filters by tags instead of categories, and it was giving me all kinds of weirdnesses. I figured out a solution with some clever use of the liquid syntax <sup>1</sup>:

```
{% unless page.category == null %}
  {% capture pageCategory %}{% page.category %}{% endcapture %}
  {% unless site.categories[pageCategory].size == 1 %}
    <div class="row related-posts">
      <h2 class="text-center">More {% page.category %} Posts! </h2>
      <div class="medium-12 small-12 columns">
        {% for post in site.categories[pageCategory] limit:6 %}
          {% unless post.title == page.title %}

            <h3>
              <a href="{% site.url %}{% site.baseurl %}{% post.url %}">
                {% post.title %}
              </a>
            </h3>

          {% endunless %}
        {% endfor %}
      </div>
    </div>
  {% endunless %}
{% endunless %}
```

- I simplified the markup that displays each related post, just to be simpler for demonstration purposes. ↩
